

## **AI Models Preparation for Deployment**

2000

To be done individually

Exercise Overview: Model Saving, Inference, and Format Comparison with CIFAR-10	Exercise Overview: Model Saving, Inference, and Format Comparison with CIFAF				
Exercise Overview: Model Saving, Inference, and Format Comparison with CIFAR-10	Exercise Overview: Model Saving, Inference, and Format Comparison with CIFAF				
		se Overview: Model Sa	ving, Inference, ar	nd Format Compa	arison with CIFAR-1

#### Part 1: Training and Saving the Model

#### **Dataset Loading and Training**

Load and preprocess the CIFAR-10 dataset using torchvision. Build a CNN model capable of classifying CIFAR-10 images (e.g., a simple ResNet or custom CNN).

#### **Saving Models in Different Formats**

Save the trained model in three formats:

.pt: Save only the model's state dictionary.

.pth: Save the entire model object with its architecture.

**ONNX:** Export and save the model to ONNX format.

#### Part 2: Inference on a Single Image

- Load the .pt file, rebuild the model architecture, and use it to predict the class of a single CIFAR-10 test image.
- Load the model directly from the .pth file and predict the class of a single CIFAR-10 test image.
- Use ONNX Runtime to load the ONNX model and predict the class of a single CIFAR-10 test image.

## **Part 3: Model Accuracy Evaluation**

Write scripts to evaluate model accuracy on the CIFAR-10 test set for each saved format.

ONNX: Evaluate using ONNX Runtime.

.pt and .pth: Evaluate using PyTorch.

## **Part 4: Format Size and Performance Comparison**

• Record and compare the file sizes of the .pt, .pth, and ONNX models.

# **Best Wishes**
